EXISTING VS. PROPOSED ANALYSIS

ANALYSIS AT CRITICAL POINT 1:

An existing versus proposed analysis was performed at Critical Point 1 (the outlet of the most downstream culvert under Ward Road) to determine if the proposed development would cause an increase in stormwater runoff while accounting for existing upstream stormwater detention. The stormwater model was built using PondPack and models a 100-year event with a Type II 24-hr distribution and a precipitation depth of 9.2 inches. The existing stormwater detention basins just upstream of the project site receive stormwater runoff from an off-site drainage area of 62.2 AC. with a Curve Number of CN = 82. This drainage area is contained within the overall 566 AC. drainage area that drains to Critical Point 1. Refer to Appendix A for a Drainage Area Exhibit.

There are two existing detention basins just upstream of the project site. The first detention basin, Basin 1, is an extended-wet retention basin. Basin 1 has a 20' long weir that leads to Basin 2. The second detention basin, Basin 2, is an extended-dry detention basin. Basin 2 has a reinforced concrete box outlet control structure with three (3) 1'x6' rectangular perpendicular orifices. Stormwater then flows through a 12" N-12 HDPE pipe that drains to the project site.

By modeling the upstream detention basins to analyze Critical Point 1, the reduction in peak flow due to the storage by the basins is incorporated. Additionally, when modeling the existing vs. proposed condition for the project site, there is an increase in impervious area and Curve Number from the existing to the proposed condition. However, the reduction in the time of concentration offsets this, resulting in a lower overall peak discharge at Critical Point 1. Refer to **Table 1** below:

Peak Flow Analysis at Critical Point 1	
	100-Year Event
Existing Peak Discharge (CFS)	1370.50
Proposed Peak Discharge (CFS)	1362.77

In conclusion, the proposed development results in an increase in impervious area. However, the reduction in time of concentration results in an overall decrease in peak flow at Critical Point 1 (Refer to **Table 1**). Refer to PondPack Results in **Appendix B** for more information.

APPENDIX A – Drainage Area Map

APPENDIX B – PondPack Report
