---

## EXISTING CONDITIONS

The site is in Lee's Summit, Missouri, in the southeast quadrant of the intersection of MO-150 and Pryor Road. The current land use of the planned development is undeveloped with low density residential surrounding the site.

### Street Network and Traffic Control

The development is bordered on the north by MO-150 and on the west by Pryor Road.

MO-150 is a four-lane east-west median divided highway with a posted speed limit of 45 miles per hour (mph).

Pryor Road is a two-lane north-south major arterial roadway with a posted speed limit of 35 mph. The intersection of MO-150 and Pryor Road is signalized with left-turn lanes on all approaches, a southbound right-turn lane, a northbound right-turn lane, and an eastbound right-turn lane.

Osage Drive (existing access into the Summit Homes development on the west side of Pryor Road) is a two-lane collector roadway, and the intersection is a stop-controlled with Osage Drive stopping. This intersection is located approximately 600 feet south of MO-150.

Cass Jackson Road (County Line Road) is a two-lane east west minor arterial roadway with a posted speed limit of 35 mph. The intersection of Pryor Road and Cass Jackson Road is a stop-controlled t-intersection with Pryor Road stopping and is located approximately one mile south of MO-150.

### Traffic Volumes

Intersections counted for analysis in this study were:

- MO-150 and Pryor Road
- Pryor Road and Cass Jackson Road

The turning movement traffic counts were completed on Tuesday, January 17<sup>th</sup>, 2023, for the peak volume time periods. Morning traffic counts were conducted from 7:00 AM until 9:00 AM and afternoon traffic counts were from 4:00 PM until 6:00 PM. The morning peak period was determined to be from 7:15 AM until 8:15 AM and the afternoon peak period was determined to be from 4:30 PM until 5:30 PM.

Trips from the approved *Summit Homes MO Route 150 and Pryor Road Traffic Impact Study* by Olsson Engineers (October 2018) were added to the traffic counts to create an existing traffic scenario as all the phases of the Summit Homes development are not yet completed.

Existing traffic volumes with the Summit Homes development are shown on Figure 3. Traffic counts and the previous study counts are included in the Appendix.

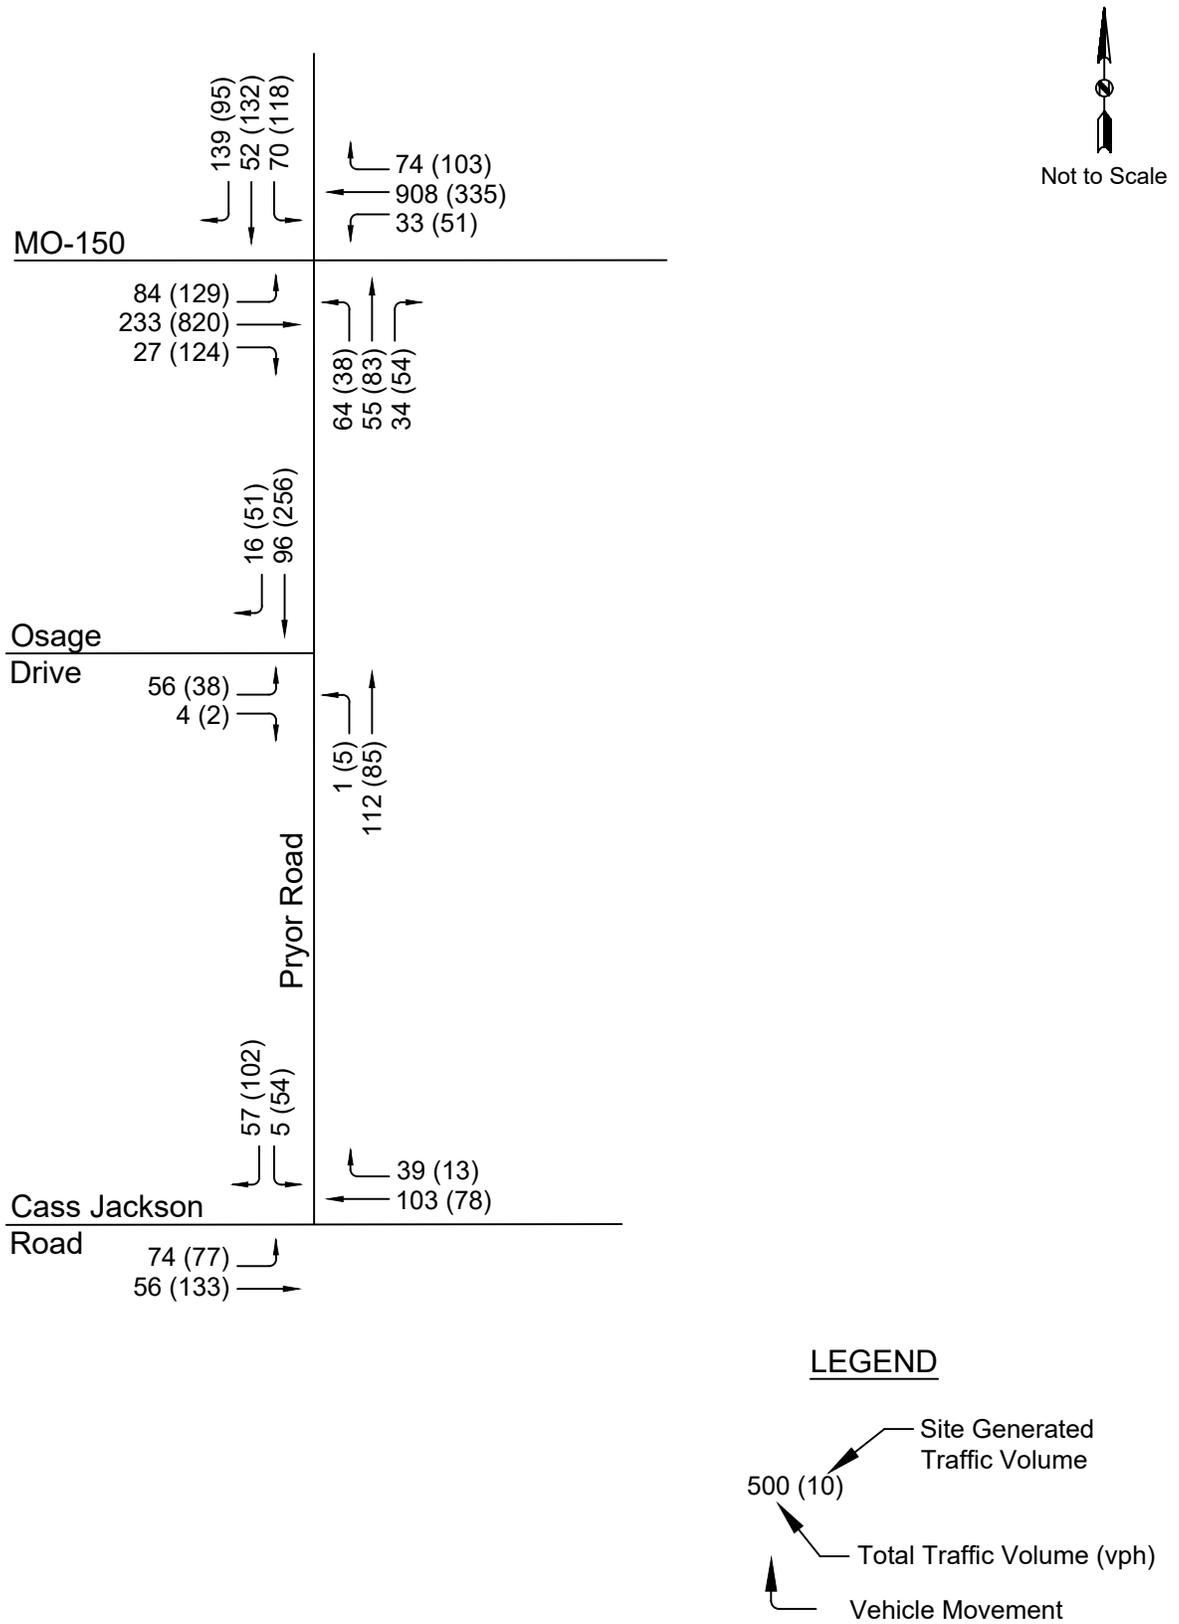

Figure 3 - Existing Traffic Volumes

---

## PROPOSED CONDITIONS

The Pryor Mixed Use development will be constructed in one phase and will consist of 280 multifamily housing units, 22,500 square feet of retail, a 5,000 square foot bank, and a 4,500 square foot restaurant.

### Access Plan

The Pryor Mixed Use development site will be accessed by two entrances. One access will be through the construction of an east leg of Osage Drive and Pryor Road. The Osage Drive access will be a full access point and will be stop controlled with the Osage Drive stopping.

The site will be accessed via MO-150 by a right-in/right-out (RIRO) access 520 feet east of the MO-150 and Pryor Road intersection.

A future connection of Osage Drive to the east will be stubbed out with the construction of this development.

### Sight Distance

Sight distance was measured at the proposed accesses using the methodology recommended by the American Association of State Highway and Transportation Engineers (AASHTO).

The posted speed limit along MO-150 at the proposed access point is 45 mph and for that speed AASHTO requires a minimum intersection sight distance of 500 feet and a stopping sight distance of 360 feet. Based on field measurements at the proposed access point on MO-150, the available intersection sight distance will be in excess of 500 feet and the measured stopping sight distance will be in excess of 360 feet.

The posted speed limit at Pryor Road and Osage Drive is 35 mph and for that speed AASHTO requires a minimum intersection sight distance of 390 feet and a stopping sight distance of 250 feet. The measured intersection sight distance and stopping sight distance was in excess of 400 feet and is adequate.

### Crash Analysis

Crashes at the study intersections were analyzed over a three-year period (2020-2022) from City of Lee's Summit Police Department data to identify existing crash patterns. There were a total of 24 crashes reported during the crash study time period at MO-150 and Pryor Road—with 10 injury and no fatal crashes.

Based on the analysis of the crashes, there were five angle, two head on, five ran-off-road, eight rear-end, two sideswipe, and one object crash. The majority of the crashes were due to distracted driving and running red lights or following too closely. The other causes ranged from falling asleep at the wheel, turning too wide, DUI, and a trash can blowing into the road.

The Pryor Road and Osage Drive intersection and the Pryor Road and Cass Jackson Road intersection had no crashes reported during the study period.

No correctable crash patterns emerged as a result of the study and no recommendations are made to alter the study intersections based on crash data.

Detailed crash summaries are included in the Appendix.

### Throat Length Analysis

The throat length for the north entrance into the site from MO-150 was compared to MoDOT’s turning lane guidelines requirements for medium traffic volume driveways. MoDOT requires a minimum throat length of 60 feet for drives with 150-400 peak hour trips and the proposed throat is approximately 105 feet, which meets MoDOT’s requirements.

The throat length for the proposed entrance into the site from Pryor Road was compared to City of Lee’s Summit *Access Management Code*, March 2018 requirements for drives adjacent to arterial roadways based on vehicles per hour. Lee’s Summit requires 125 feet minimum drive throat length on arterial roadways with projected two-way peak hour volumes between 100 and 400 vehicles per hour (vph). The proposed throat length at Osage Drive is 150 feet, which exceeds the City’s requirements.

### Trip Generation

The expected trip generation for the development was estimated using the 11<sup>th</sup> Edition of the Trip Generation Handbook published by the Institute of Transportation Engineers. The trip generation was based on Peak Hour of Adjacent Street Traffic, One Hour Between 7 and 9 AM along with Peak Hour of Adjacent Street Traffic, One Hour Between 4 and 6 PM criteria.

Estimates for the expected trips generated by the development are provided in Table 1.

Table 1 – Trip Generation					
ITE Land Use Code	Units	A.M.		P.M.	
		Trips In (vph)	Trips Out (vph)	Trips In (vph)	Trips Out (vph)
220- Multifamily Housing (Low-Rise)	280 dwelling units	26	84	89	52
822- Strip Retail Plaza	22,500 sq ft	29	20	69	69
912 – Drive-In Bank	5,000 sq ft	25	25	53	52
932- High-Turnover (Sit-Down) Restaurant	4,500 sq ft	29	23	19	12
<b>TOTAL</b>		<b>109</b>	<b>152</b>	<b>230</b>	<b>185</b>

---

## Trip Distribution

The trip distribution pattern was determined for the site based on the existing directional traffic pattern of the peak period and based on a general analysis of the surrounding area. The detailed distribution patterns can be found in the appendix. Based on the existing traffic patterns, the type of development, location of nearby schools, and the metropolitan population centers, the new trips were assigned onto the roadway network, as shown below for the morning and afternoon periods.

Trip distribution during the morning peak period:

- 15% to/from the north
- 5% to/from the south
- 55% to/25% from the east
- 25% to/55% from the west

Trip distribution during the afternoon peak period:

- 20% to/from the north
- 5% to/from the south
- 25% to/50% from the east
- 50% to/25% from the west

## Existing Plus Site Traffic Volumes

The expected development site-generated traffic volumes were added to the existing traffic scenario. The volumes are shown on Figures 4 and 5.

## Future Traffic Volumes

Future traffic volumes were generated at a rate of 2% annual growth over a twenty-year period. The calculated traffic volumes were added to the existing plus site traffic. The volumes for the future morning and afternoon peak hours are shown on Figure 6.

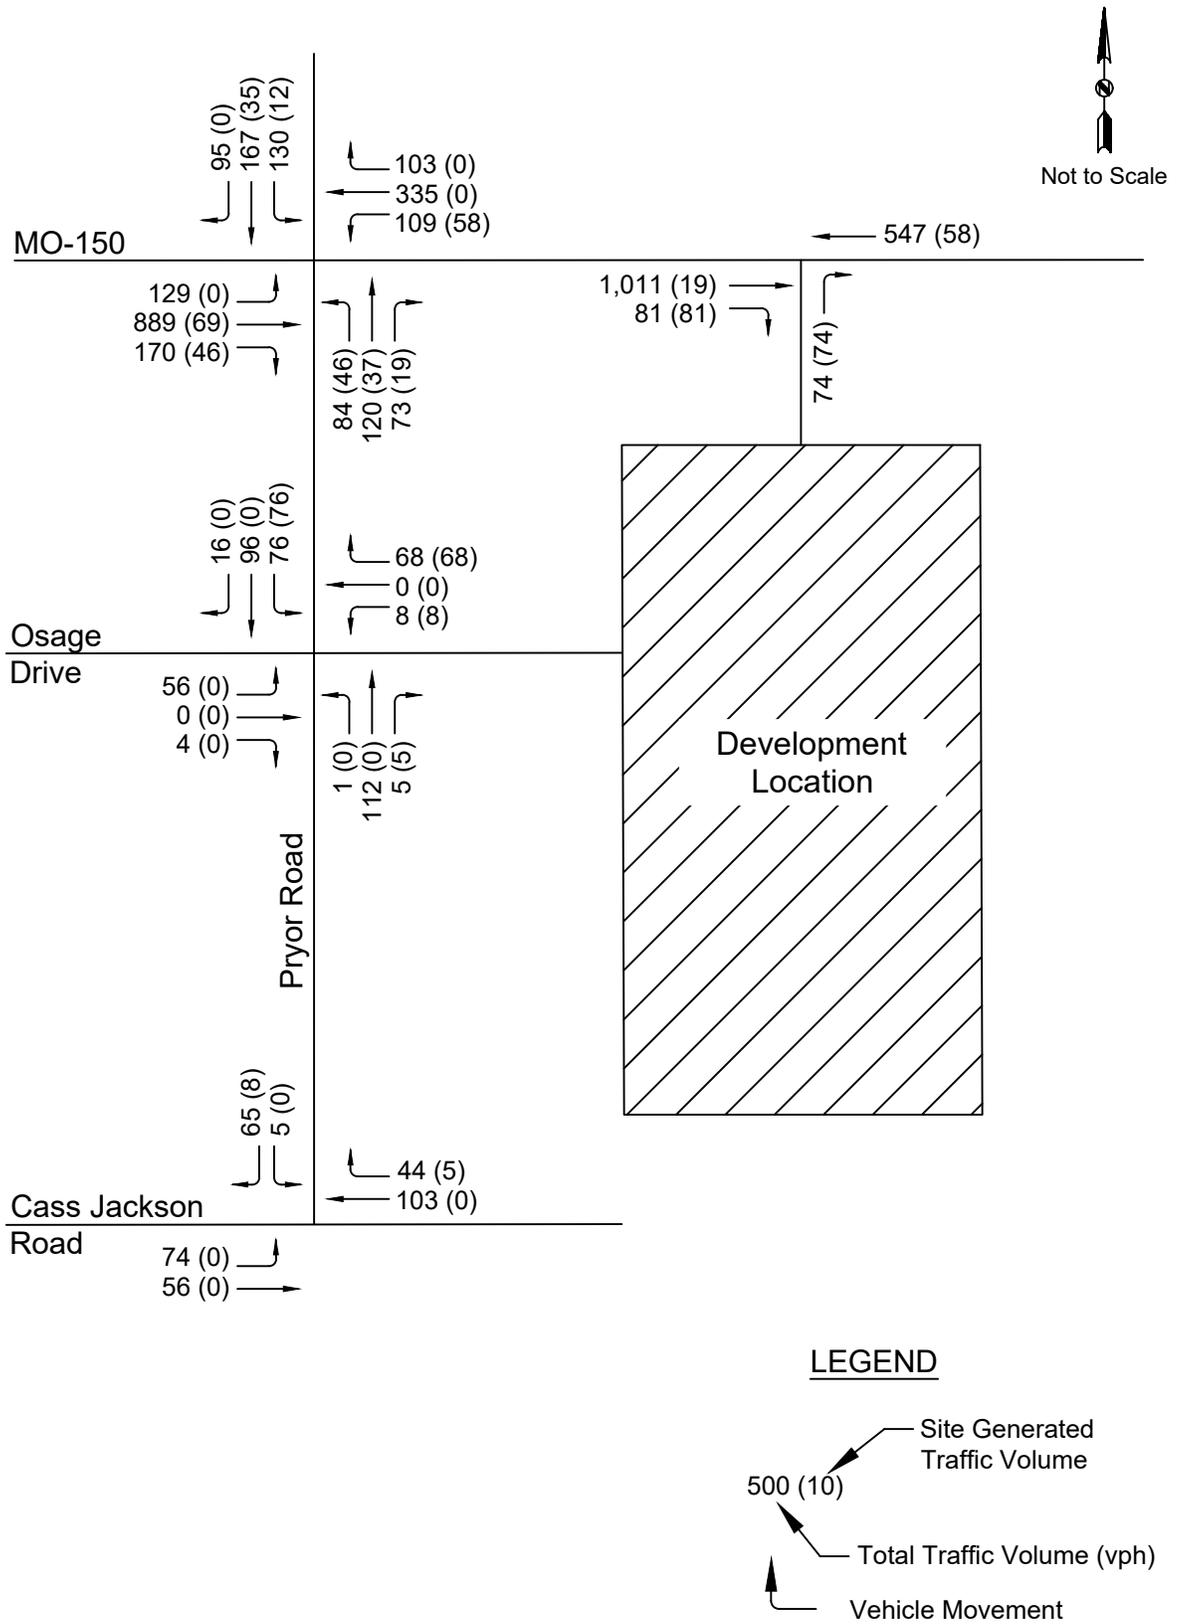

Figure 5 - Existing plus Site PM Volumes

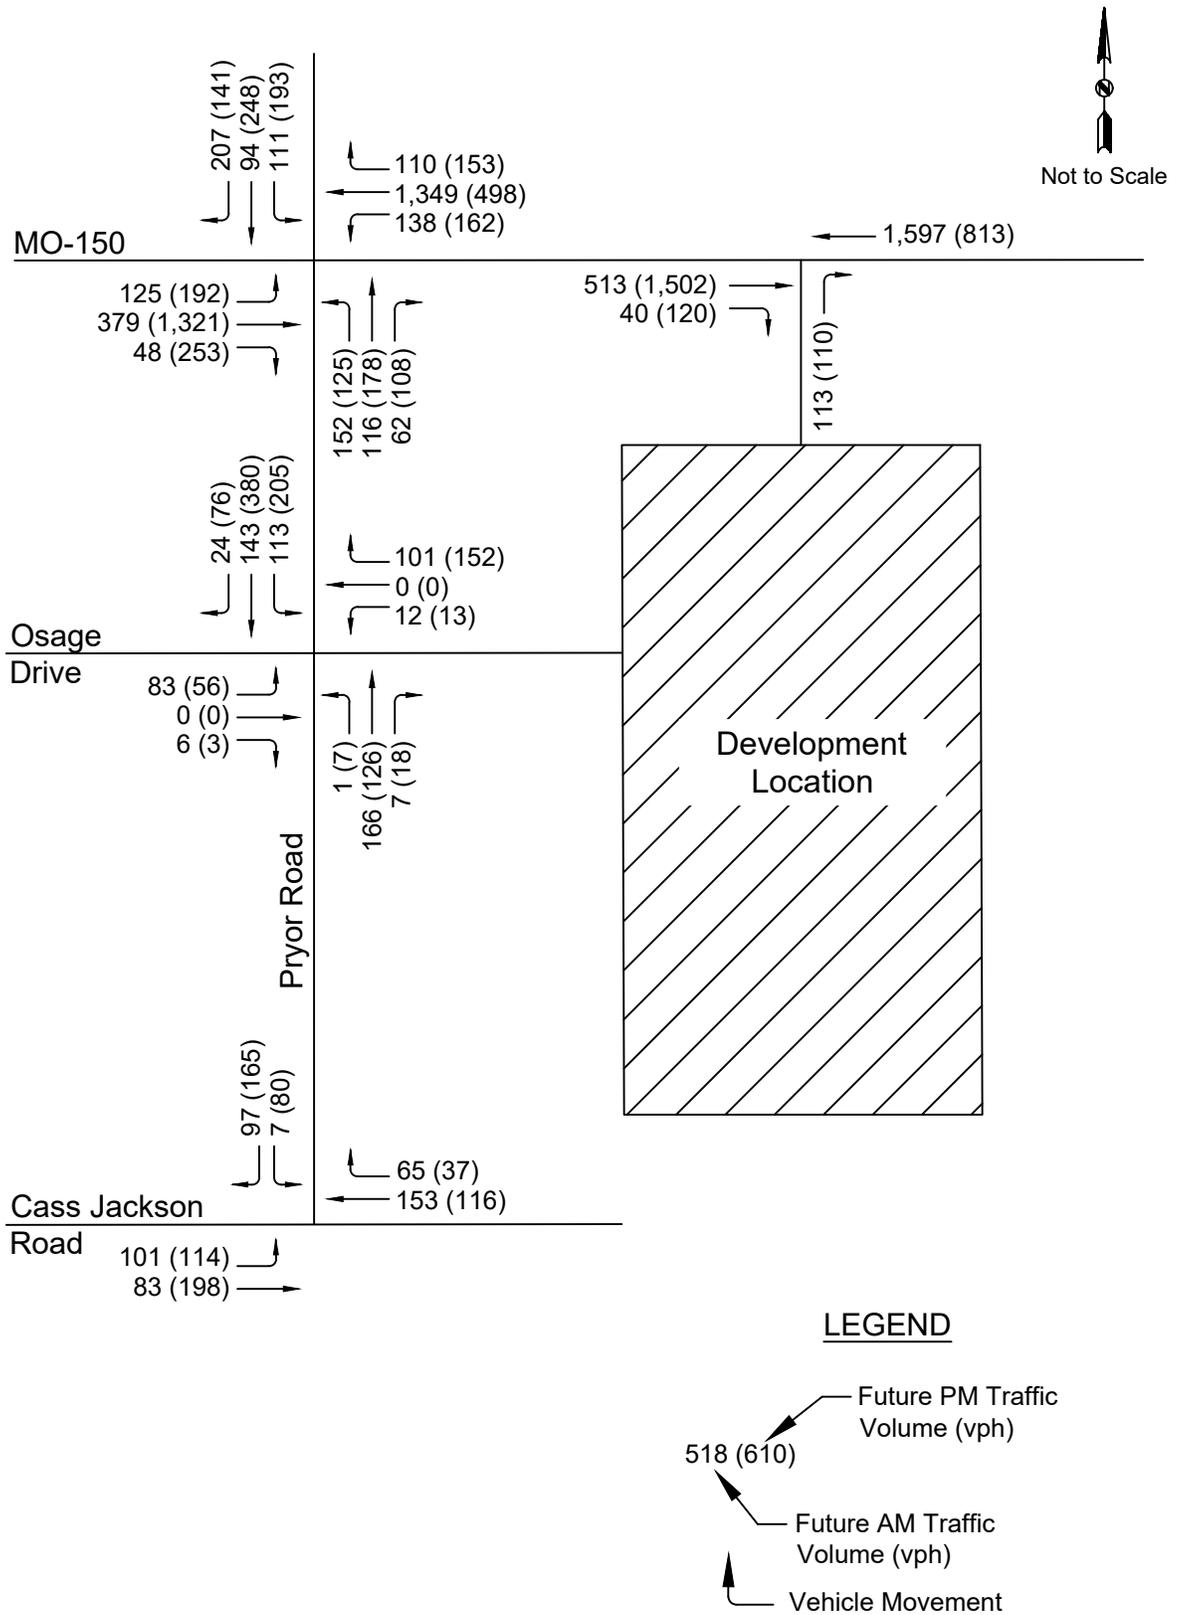

Figure 6 - Future AM & PM Volumes

---

## Signal Warrant Study

It may be considered justified to install a traffic signal at a location if one or more of the traffic signal warrants listed in the 2009 MUTCD is met. The traffic signal warrants are:

- Warrant 1: Eight-Hour Vehicular Volume
- Warrant 2: Four-Hour Vehicular Volume
- Warrant 3: Peak Hour
- Warrant 4: Pedestrian Volume
- Warrant 5: School Crossing
- Warrant 6: Coordinated Signal System
- Warrant 7: Crash Experience
- Warrant 8: Roadway Network
- Warrant 9: Intersection Near at Grade Crossing

Warrants 3 and 7 were evaluated at the analysis intersections as part of this study at the Pryor Road and Osage Drive intersection and at the Pryor Road and Cass Jackson Road intersection.

### ***Warrant 3: Peak Hour***

The peak hour warrant is satisfied if either of the two following conditions are met:

A: This condition is satisfied if any of the following conditions are met for a period of one hour during an average day:

1. The total stopped time delay experience by the traffic on one minor-street approach (one direction only) controlled by a stop sign equals or exceeds: 4 vehicles-hours for a one-lane approach or five vehicle hours for a two-land approach and
2. The volume on the same minor-street approach (one directions only) equals or exceeds 100 vehicles per hour for one moving lane of traffic or 150 vehicles per hour for two moving lanes and
3. The total entering volume serviced during the hour equals or exceeds 650 vehicles per hour for intersections with three approaches or 800 vehicles per hour for intersections with four or more approaches.

(Condition A is not being examined in this study)

B: The peak hour warrant is satisfied if the vehicles per hour on both approaches of the major street and the vehicles on the higher volume approach of the minor street for one hour fall above the 2009 MUTCD Warrant 3 curve.

### ***Warrant 7: Crash Experience***

The crash experience warrant is met if all of the three following conditions are met:

A: The crash experience warrant is met if alternatives and enforcement has failed to reduce crash frequency over a satisfactory trial period.

B: The crash experience warrant is met five or more correctable crashes have occurred within a 12- month period.

C: For each of any eight hours of an average day, the vehicles per hour given are 80 percent of Condition A in Table 4C-1 or the vehicles per hour in are 80 percent of Condition B in Table 4C-1 or 80 percent of the requirements specified in the Pedestrian Volume warrant. These major-street and minor-street volumes shall be for the same 8 hours.

### ***Analysis***

Based on traffic signal warrant analysis, a traffic signal is not warranted at either study intersection for the existing, existing plus site, or future traffic volumes. The raw data and graphs from the 2009 MUTCD are included in the Appendix.

## **Left and Right-Turn Lane Warrants**

The need for a right-turn lane at the site entrance on MO-150 was evaluated using MoDOT's turning lane guidelines for four-lane roadways for the existing plus site condition. The existing plus site traffic volumes during the afternoon peak hour are expected to warrant a right-turn lane during peak periods for the MO-150 access.

The need for right and left-turn lanes into the site at Osage Drive was evaluated using the City of Lee's Summit *Access Management Code*, March 2018 turning lane guidelines as part of this study for the existing plus site and future condition.

### ***Left-Turn Warrant***

Left-turn lane guidelines per City of Lees Summit *Access Management Code*:

16.1.B. Left-turn lanes shall be provided on all arterial streets at the intersection with other arterial and collector streets. Left-turn lanes shall be provided on minor arterial streets at the intersection with any local street or driveway where the left-turn volume is at least 20 vehicles in any hour. On major arterial streets, left-turn lanes shall be at the intersection with all connectors (an exception may be granted for a singular, existing, residential lot).

16.1.H. The minimum length of left-turn lane should be 250 feet plus taper on an arterial street intersecting another arterial street and 200 feet plus taper on an arterial street at other locations. The minimum length of left-turn lane on collectors should be 150 feet plus taper. The minimum length of left-turn lane on connectors should meet the driveway throat length requirements.

Left-turn lanes will be required southbound on Pryor Road at Osage Drive as Pryor Road is classified as an arterial roadway.

**Right-Turn Warrant**

Right-turn lane guidelines per City of Lees Summit *Access Management Code*:

16.2.A. Required on arterial streets at each intersecting street or driveway where the right-turn volume on the major arterial street is or is projected to be at least 30 vehicles in any hour, or the right-turn volume on the minor arterial street is or is projected to be at least 60 vehicles in any hour. Minimum length should be 250 feet plus the taper on a major arterial at the intersection of another arterial street or 200 feet plus the taper on a minor arterial at the intersection with another arterial street or on a major arterial at the intersection of a collector and 150 feet plus the taper at other locations along arterial streets.

The traffic volumes are not expected to meet the right-turning volume criteria northbound at Osage Drive as the volumes are projected to be less than 30 vehicles even during future conditions.

The raw analysis data is included in the Appendix.

**CAPACITY**

The capacity analysis for the study intersections was completed using the methodology outlined in the Highway Capacity Manual, 6th Edition. The volume and capacity analysis was completed using Trafficware SYNCHRO software (latest version). The criteria for determining Level of Service (LOS) for signalized and unsignalized study intersections and access points are based on the average vehicle delay and is outlined in Table 2 below. Level of Service is defined as the measure of the quality of traffic flow and is graded from “A” to “F”—with “A” being the best situation and “F” being the worst.

Table 2 – Intersection Level of Service		
Level of Service (LOS)	Average Control Delay (sec/veh)	
	Unsignalized	Signalized
A	< 10	< 10
B	< 15	< 20
C	< 25	< 35
D	< 35	< 55
E	< 50	< 80
F	≥ 50	≥ 80

## Existing Conditions

### MO-150 and Pryor Road

The analysis was completed using the existing MoDOT supplied traffic signal timings.

All approaches operate at a LOS D or above for the morning and afternoon peak periods, with the exception of the southbound right-turn movement during the morning peak period, which operates at a LOS E. The north and southbound right and left-turn queues exceed the turn-lane storage capacity. The east and westbound turning queues have sufficient capacity for queuing vehicles. The overall LOS for the intersection is a LOS C during the morning and afternoon peak period.

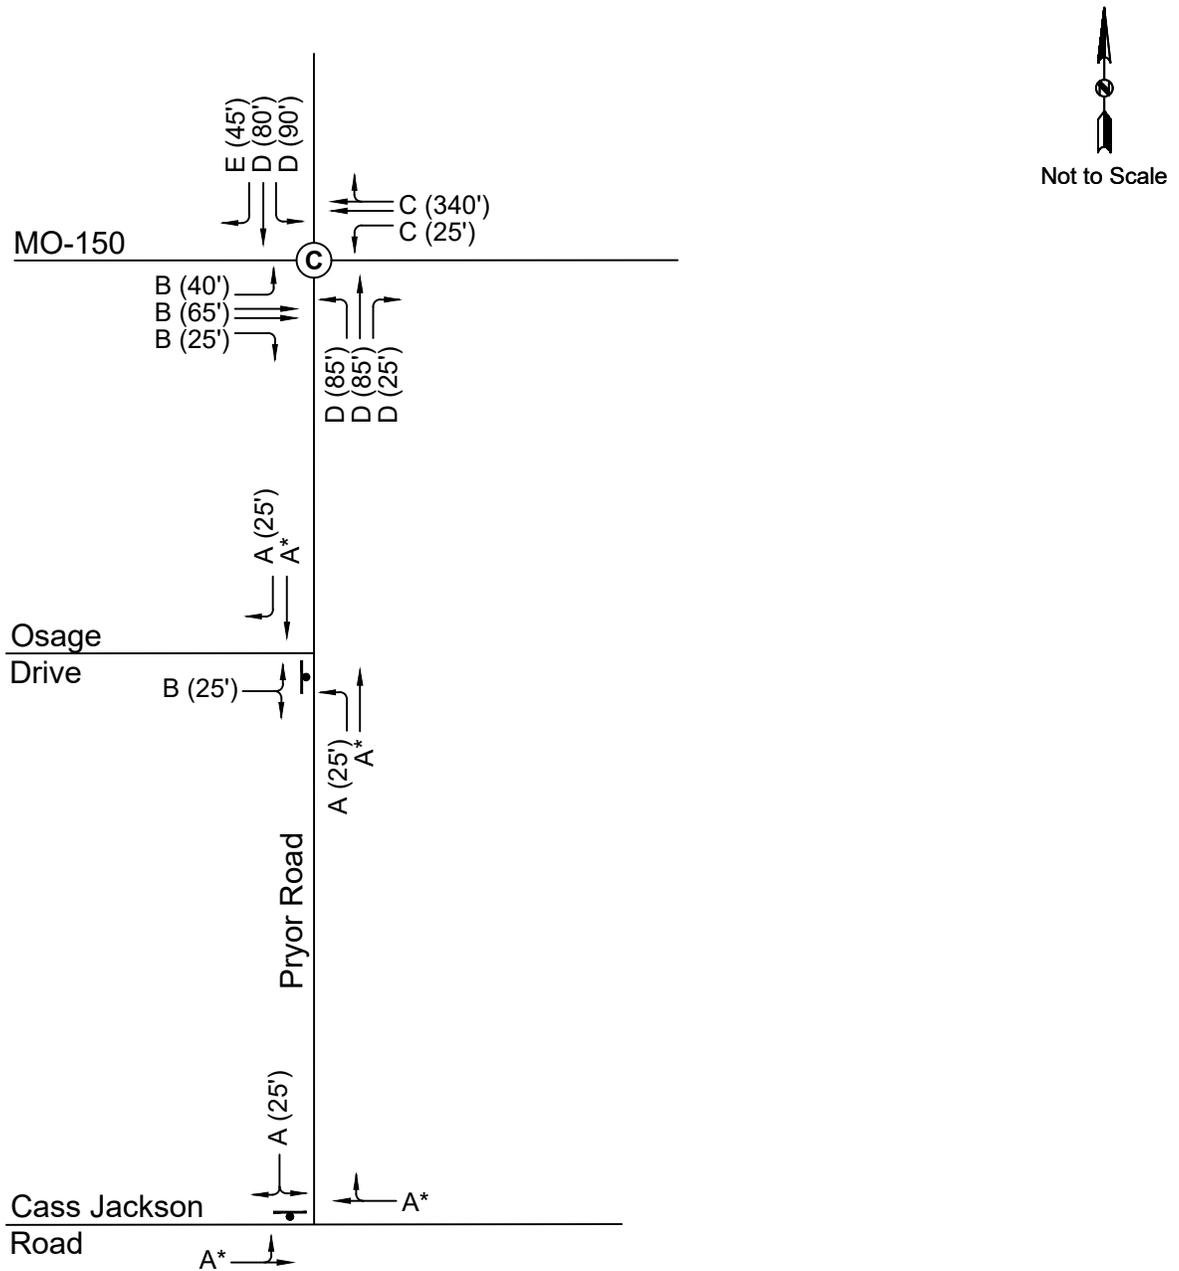

### Pryor Road and Osage Drive

All approaches operate at a LOS B or above for the morning and afternoon peak periods and the intersection has sufficient capacity for queuing vehicles.

### Pryor Road and Cass Jackson Road

All approaches operate at a LOS B or above for the morning and afternoon peak periods and the intersection has sufficient capacity for queuing vehicles.

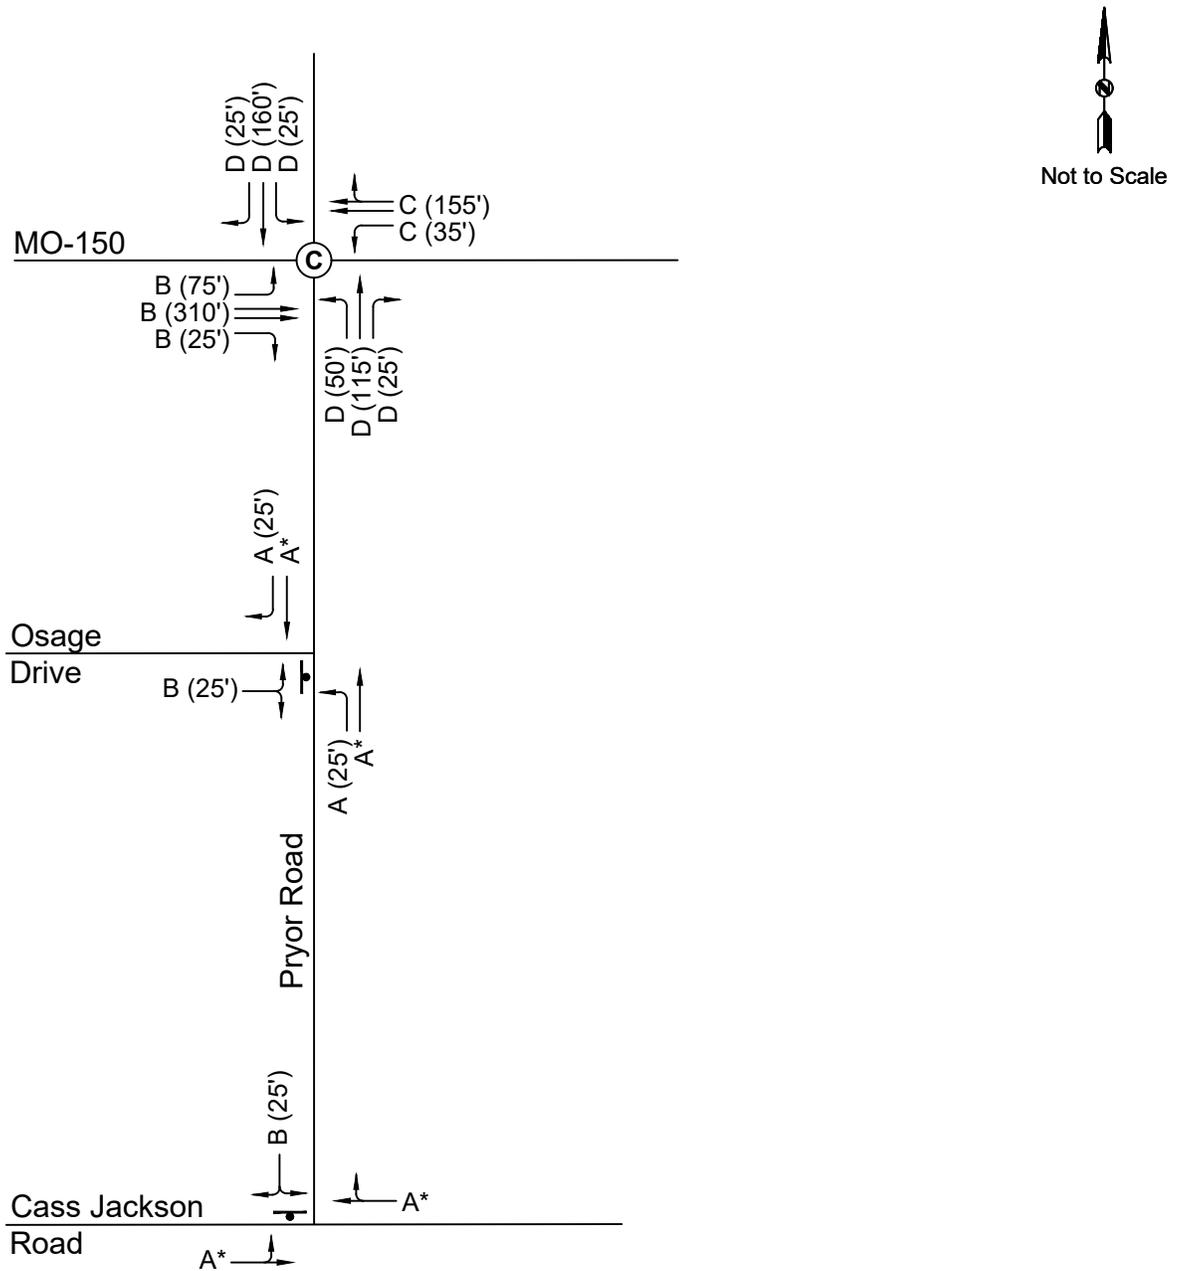

The results of the existing conditions analysis are shown for the morning and afternoon peak hours along with lane configuration and queue lengths on Figures 7 and 8.

**Figure 8 - Existing PM Level of Service**

## Existing Plus Site Conditions

### MO-150 and Pryor Road

Signal timings were optimized to account for the additional traffic.

There is no significant change in the operations of this intersection from the existing conditions. All approaches (except the southbound right-turn during the morning peak period) continue to operate at a LOS D or better for the morning and afternoon peak periods and the east and westbound movements have sufficient capacity for queuing vehicles.

### MO-150 and RIRO Access

The analysis was completed with an eastbound right-turn lane per MoDOT's turn lane criteria.

The through movements of MO-150 are not stop-controlled therefore operate in a free-flow condition. All approaches operate at a LOS B or better and will sufficient capacity for queueing vehicles.

### Pryor Road and Osage Drive

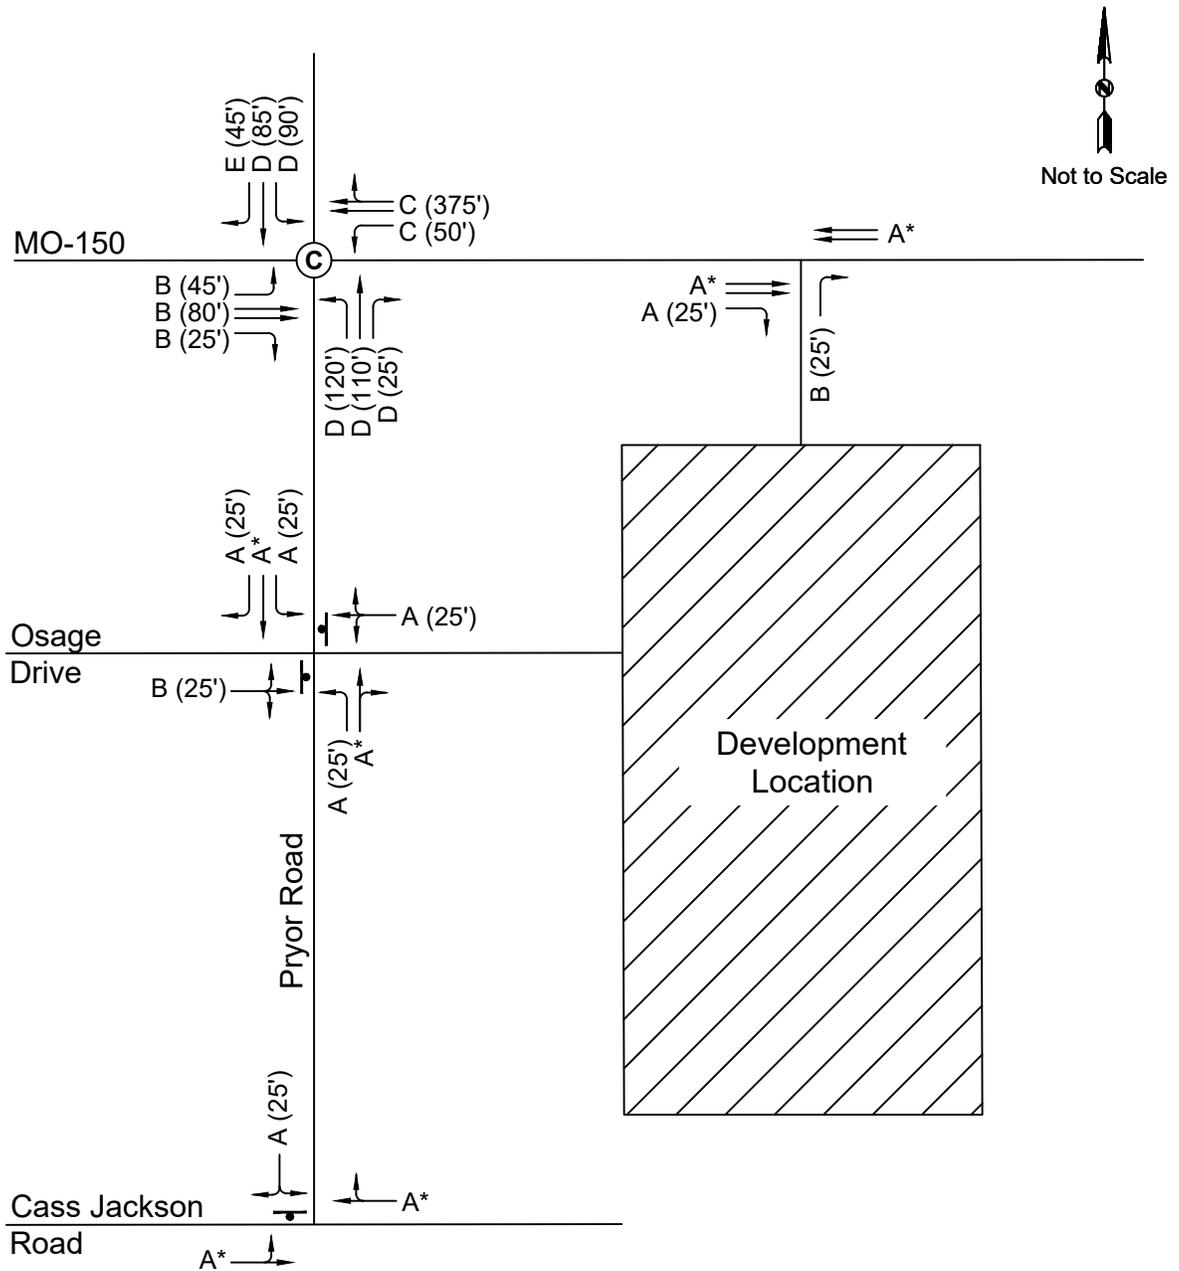

The analysis was completed with southbound left-turn lane per City of Lee's Summit turn lane criteria.

All approaches operate at a LOS C or better for the morning and afternoon peak periods and the intersection has sufficient capacity for queuing vehicles.

### Pryor Road and Cass Jackson Road

There are no significant changes in the operations expected from the existing conditions. The approaches continue to operate at a LOS C or better for the morning and afternoon peak periods and the intersection has sufficient capacity for queuing vehicles.

The results of the existing plus site analysis for the morning and afternoon peak hour conditions along with lane configuration and queue lengths are shown on Figures 8 and 9.

---

## Future Conditions

Future analysis is intended to provide a high-level overview of increases in trips as other developments occur and provide recommendations for reserving right-of-way for future expansion. Signal timings of intersection movements were optimized to account for the additional traffic.

### MO-150 and Pryor Road

*With current lane configurations:* The future additional traffic is expected to cause multiple movements to drop to a LOS E and LOS F for both the morning and afternoon peak period and a majority of the turning queues will exceed turn bay storage capacity.

*With increased roadway capacity (additional lanes):* All approaches are expected to operate at a LOS D or better and the intersection will have sufficient capacity for queuing vehicles. Long range planning should consider adding additional through lanes or increasing storage length. The improvements to MO-150 and Pryor Road would require additional right-of-way through the corridor.

### MO-150 and Access

All approaches operate at a LOS C or better for the morning and afternoon peak periods and the intersection has sufficient capacity for queuing vehicles.

### Pryor Road and Osage Drive

The increase in traffic volumes will cause the eastbound movement to drop from a LOS C to a LOS F during the afternoon peak period. The storage length is adequate for this movement, and the intersection does not warrant a signal at this time, which limits the recommended improvements. There are alternative routes available during the peak periods—as this drive accesses the residential section of the development most of these trips would be vehicles that are familiar with peak hour characteristics and know to take an alternative route during the afternoon peak period.

### Pryor Road and Cass Jackson Road

All approaches operate at a LOS C or better for the morning and afternoon peak periods and the intersection has sufficient capacity for queuing vehicles.

The results of the future analysis is shown for the morning and afternoon peak hour conditions along with lane configuration and queue lengths on Figures 10 and 11.

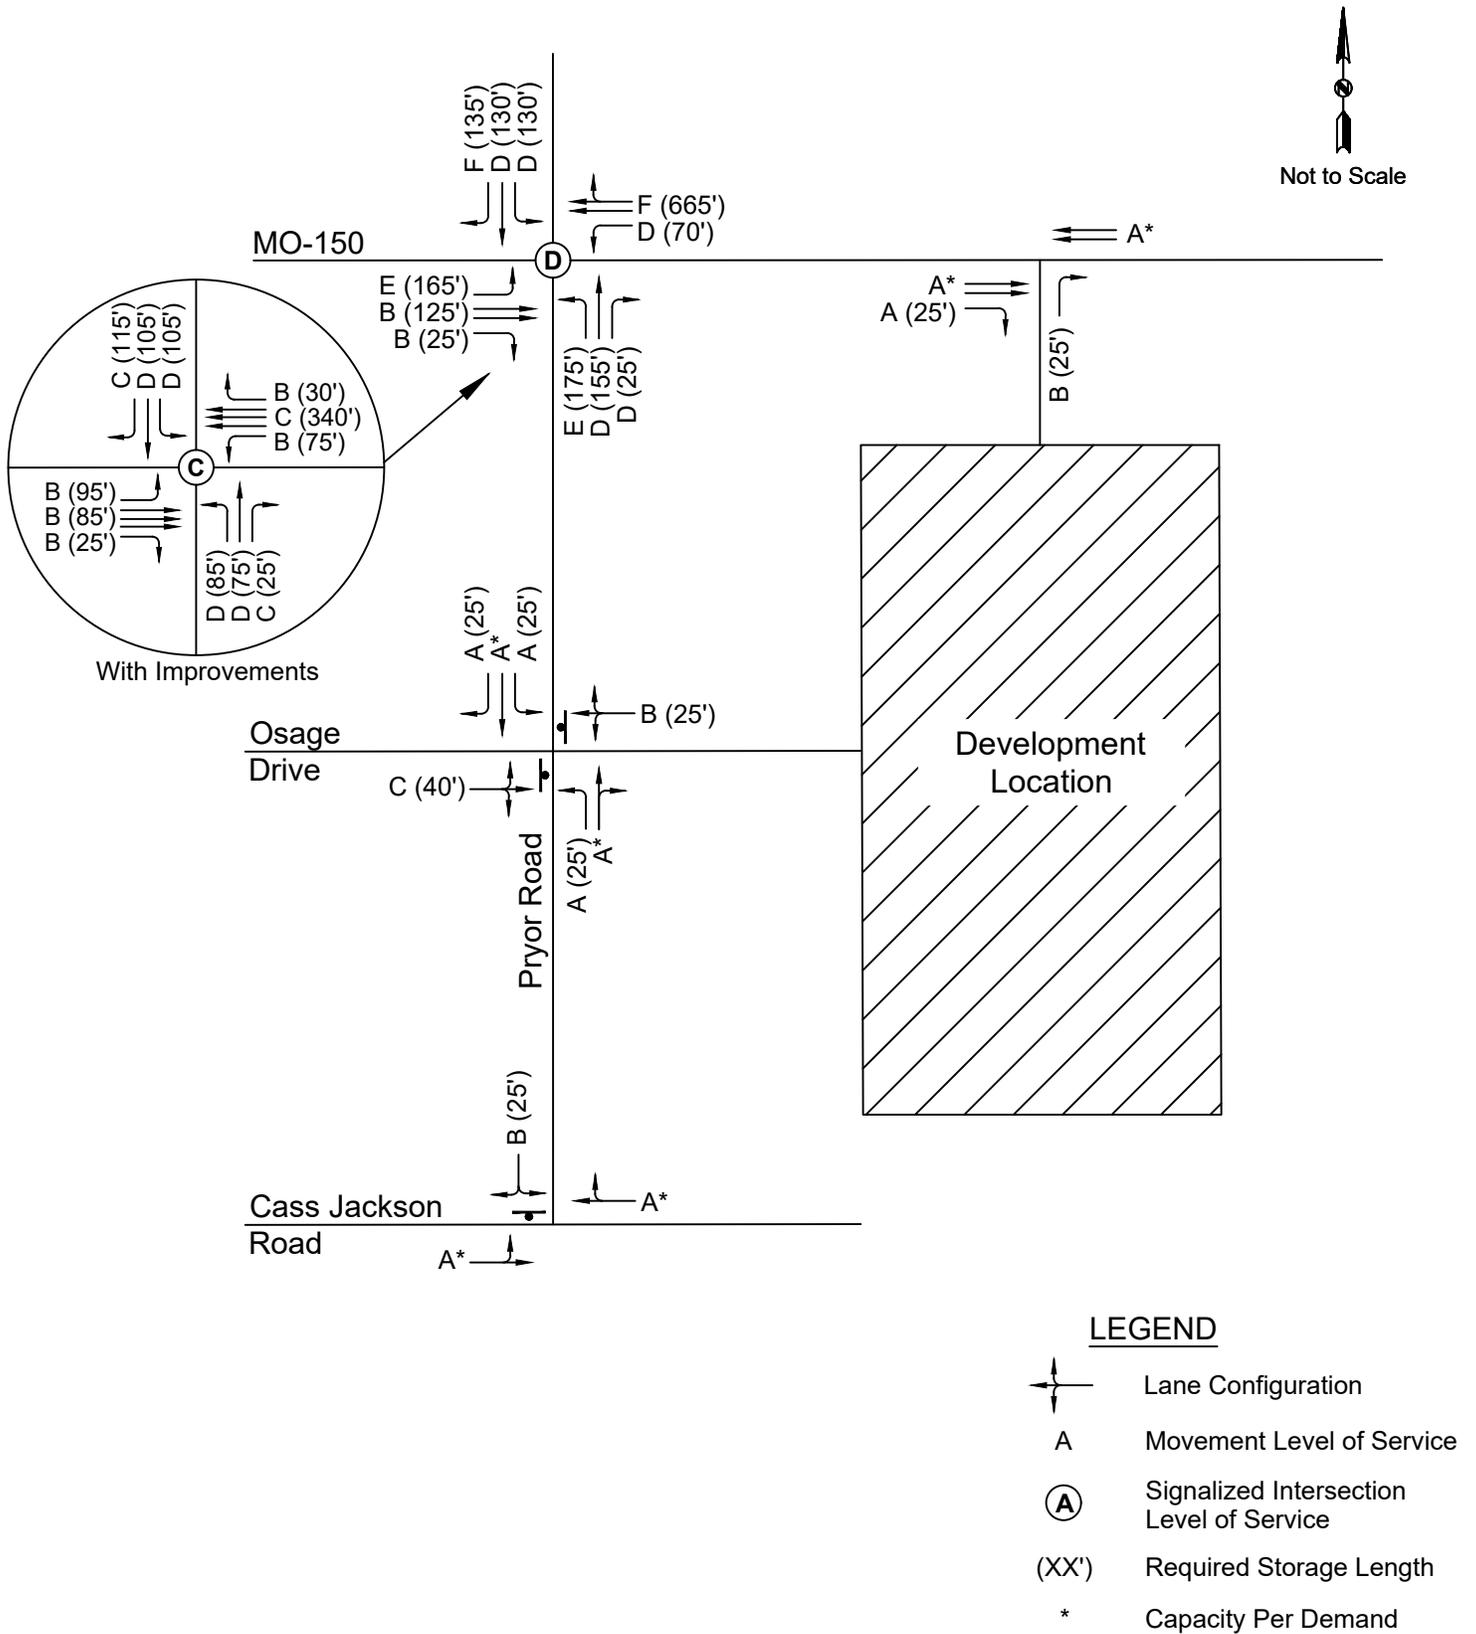

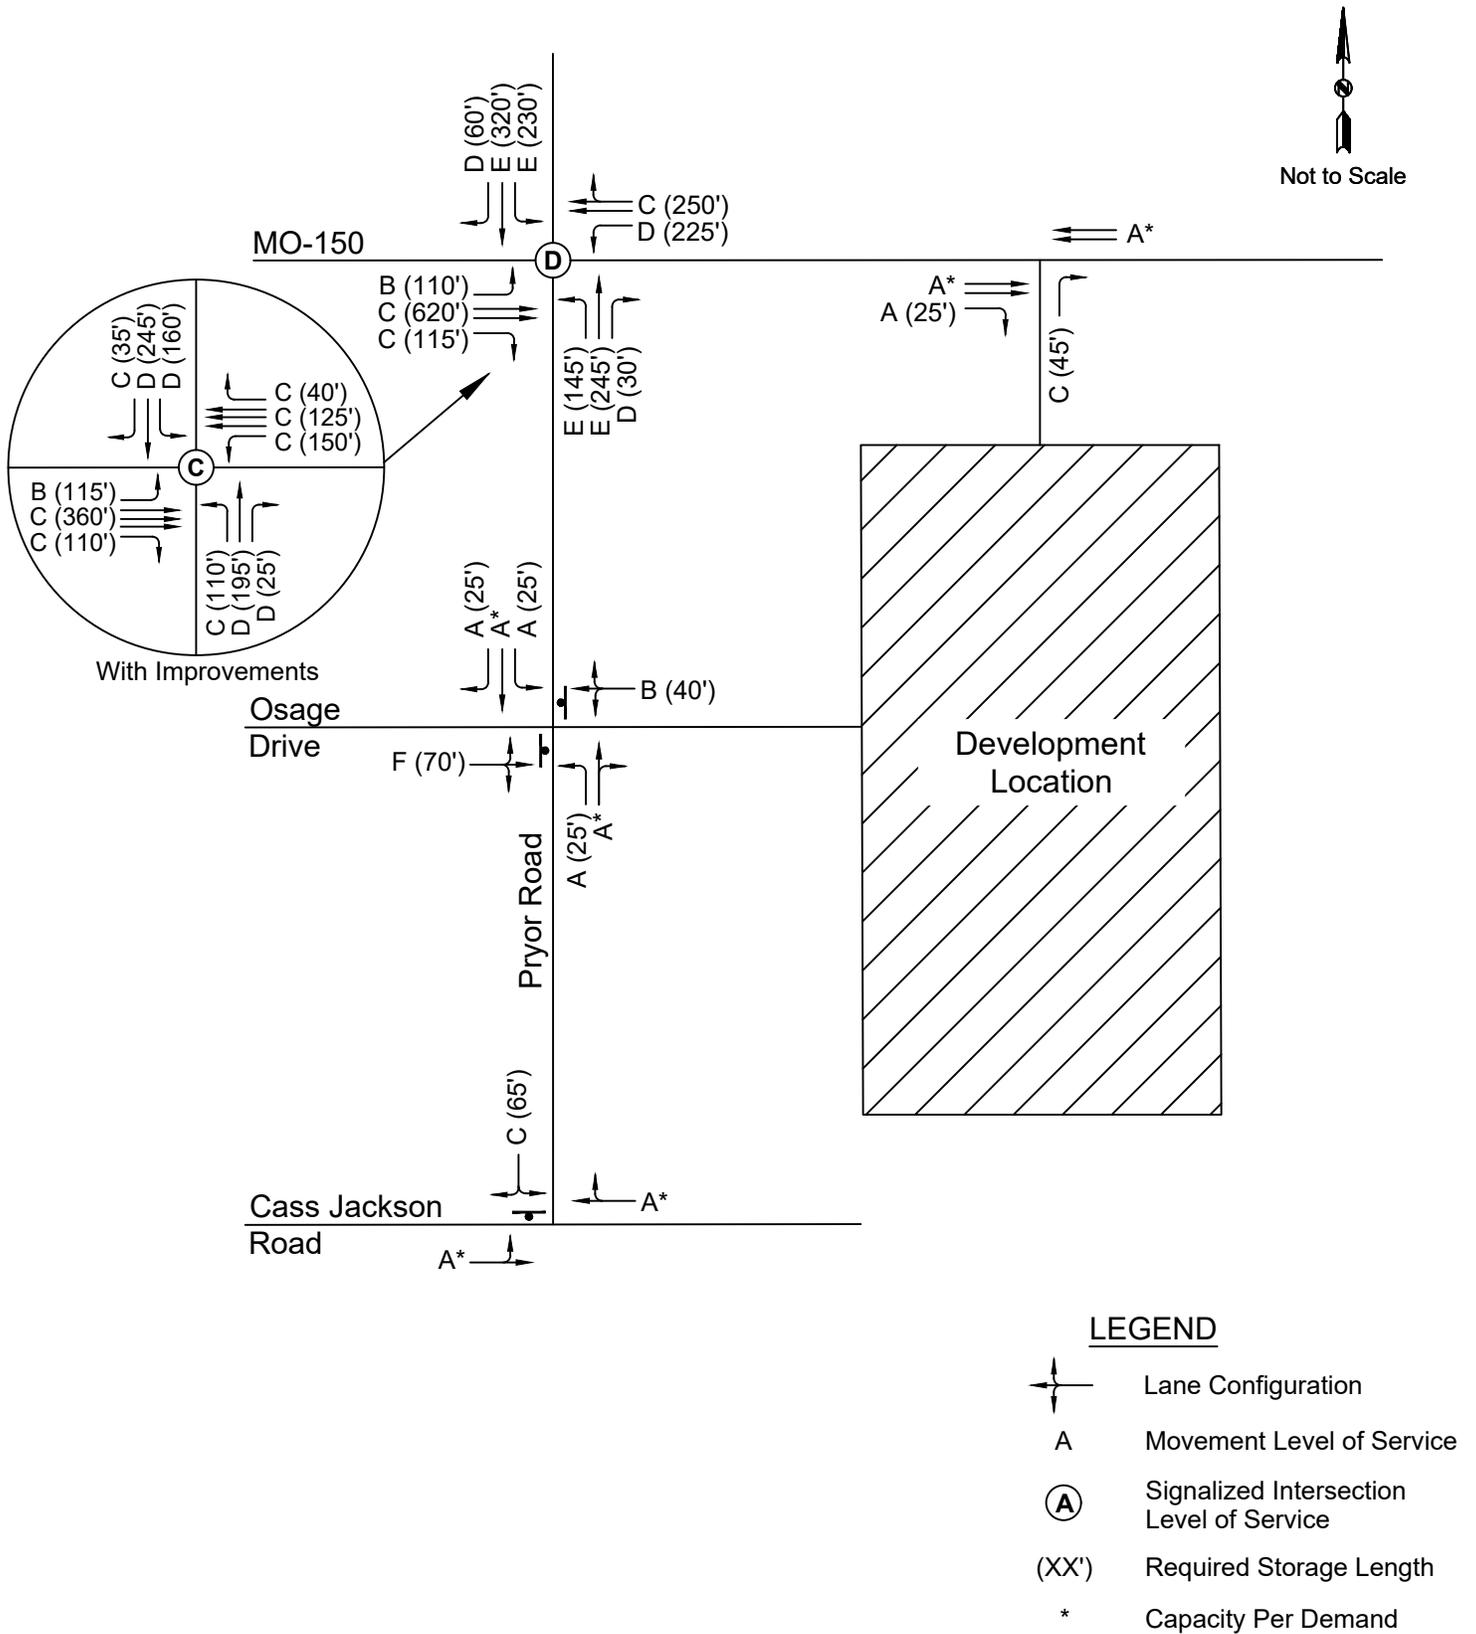

Figure 11 - Future AM Level of Service

---

## RECOMMENDATIONS

This study documents the findings of the traffic analysis of the expected traffic for the Pryor Mixed Use development in Lees Summit, Missouri. The study includes an analysis of the existing conditions, existing plus site conditions, and future conditions.

- Install an eastbound right-turn lane (200 feet plus taper) at the RIRO intersection of MO-150 and site access.
- Extend the existing northbound right-turn lane (200 feet plus taper) at the intersection of MO-150 and Pryor Road.
- Restripe the painted median on Pryor Road to create a southbound left-turn lane (200 feet plus taper) at the intersection of Pryor Road and Osage Drive.
- Reserve right-of-way for potential improvements to the MO-150 and Pryor Road intersection.
- Adjust signal timings at MO-150 and Pryor Road. Update traffic signal equipment to a northbound four-section head and APS equipment for new crosswalks.
- The need for future roadway improvements should be reevaluated as additional development occurs and a study for long-term improvements along MO-150 should be considered.

### MO-150 & Access - AM & PM

1. Advancing Volume (veh/hr) - The advancing volume is to include the right-turn, left-turn and through movements in the same direction as the right turning vehicle.
2. Right Turning Volume (veh/hr) - The right turning volume is the number of advancing vehicles turning right.
3. Operating Speed (mph) - The greatest of anticipated operating speed, measured 85th percentile speed or posted speed.

### Intersection Summary

HCM 6th Ctrl Delay	22.1
HCM 6th LOS	C

### Notes

\* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [SBR] is excluded from calculations of the approach delay and intersection delay.

### Intersection Summary

HCM 6th Ctrl Delay	29.3
HCM 6th LOS	C

### Notes

\* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [SBR] is excluded from calculations of the approach delay and intersection delay.
